

Tech Tip

Russound Controllers with multiple 3rd party control systems

Russound controllers (ACA-E5, CAV, CAM, CAA) have only 1 serial port. If control of a Russound Controller is needed from multiple control systems then an additional serial port is needed. This second serial port can be obtained from a Russound ST2 or from a Avocation Systems SR-2. The SR-2 is a serial router that allows two 3rd party control systems to simultaneously operate a Russound Controller from a single serial port. If control is needed from more than 2 control systems then multiple SR-2's can be stacked to achieve additional serial ports.

Communications through Port A or Port B will be sent to the Master Port. When the product responds through the Master Port the communications will be sent to both Port A and Port B. Please note that the SR-2 only has RX, TX and Ground signals and is capable of transmissions speeds up to 460800 baud.

Purchase the SR-2 directly from Avocation Systems.
